

TP-Link Access Point Setup Guide

1. Download the Zappie firmware file for your specific TP-Link access point if you haven't done so already and save it to your computer.
2. Don't install any CD's shipped with the device.
3. Plug the "LAN" port into your computer. Make sure your computers network settings are set to Static and assign the ip address 192.168.0.1 with subnet 255.255.255.0.
4. Open your internet browser and navigate to <http://192.168.0.1/>, you'll be prompted to login. If this doesn't work, change the ip address in step 3 from 192.168.0.1 to 192.168.1.1 and try again <http://192.168.1.1/>. The username is admin and the password is admin.
5. Once logged in, click "System Tools" on the left hand menu and then "Firmware Upgrade"

7. Select the Zappie firmware file you saved to your computer earlier and then click the "Upgrade" button

8. The upgrade process will take approximately two minutes. Do not turn off the access point.

9. Once the update is complete, plug the access point LAN port directly into your modem or internet source.
10. On your WiFi enabled device, look for the SSID/WiFi Network called "Zappie Hotspot" and join this network. Your device should be assigned an ip address in the range of 100.88.66.X.
11. Try navigating to any non SSL domain, eg <http://www.google.com> and you should be redirected to the Zappie sign up page. Signing up is free and simply ties your access point with a Zappie operators account.
